TI - FERROELECTRIC MEMORY DEVICE  
AB - PROBLEM TO BE SOLVED: To realize a ferroelectric memory device by which occurrence of imprint in a ferroelectric memory cell can be detected by using a simpler and smaller scale circuit than a Sawyer-Tower circuit.  
- SOLUTION: The occurrence of imprint can surely be detected by using a simpler and smaller scale circuit than the Sawyer-Tower circuit by providing a preserved temperature measuring circuit 3 for judging whether the imprint is caused in the ferroelectric memory cell of a memory cell section 2 or not based on data of accumulated stress caused by high temperature preservation of the ferroelectric memory device itself. The size of the ferroelectric memory device can be made small.
